SpinnerTech

IT Security

Safe, Secure and Compliant

Safeguard your business from the growing infrastructure threats that plague companies worldwide. Our onsite assessment examines your current IT operations for vulnerabilities. With our security plan, we carefully inspect every administrative, technical and physical security control susceptible to attack. We then review your business plans and implement software and best practices that enables your company to grow free from threats.

- 62% of all cyber attacks are aimed at small and mid-sized businesses

- 60% of small companies go out of business within six months of a cyber attack

*IBM

*U.S. National Cyber Security Alliance

SpinnerTech

> We help identify and manage computer access over your network

Our Comprehensive Protection Plan

We examine every component of your business to implement the latest technology and best practices to build and maintain a safe IT environment that includes all administrative, technical and physical security controls.

Network Security

First, we ensure basic authentication is properly configured to provide users with access to the information and programs they need to perform their work. In addition, more secure multi-factor authentication is available to further protect your public and private networks from unauthorized access.

Certified Penetration Testing

We determine if your systems are susceptible to attack, if defenses are adequate, and which fortifications can be defeated, if any. Our primary goal is to find vulnerabilities that could be exploited by a nefarious actor and provide mitigation strategies.

Endpoint Protection

We help identify and manage computer access over your network and restrict website access to comply with your policies and standards. Virtual private network (VPN) client, operating systems, and updated antivirus software are a few of the components included in our endpoint security management service.

IPS/IDS Protection

Traffic you don't want on your network, whether that is games or malware, is monitored and managed. We can differentiate network traffic to minimize altering the flow of legitimate information and isolate the data you don't want.

Sophos/Cisco UTM Solutions

We can reduce complexity by monitoring and managing firewall, intrusion detection, anti-malware, spam & content filtering, and VPN capabilities through a single management console. More advanced features are also available such as identity-based access control, load balancing, quality of service (QoS), intrusion prevention, SSL and SSH inspection.

A Partner You Can Trust

SpinnerTech uses state-of-the-art technology that exceeds industry security standards. Our practices and technology are certified and maintained by leading security organizations to ensure your business is safeguarded.
